[ABSTRACT]

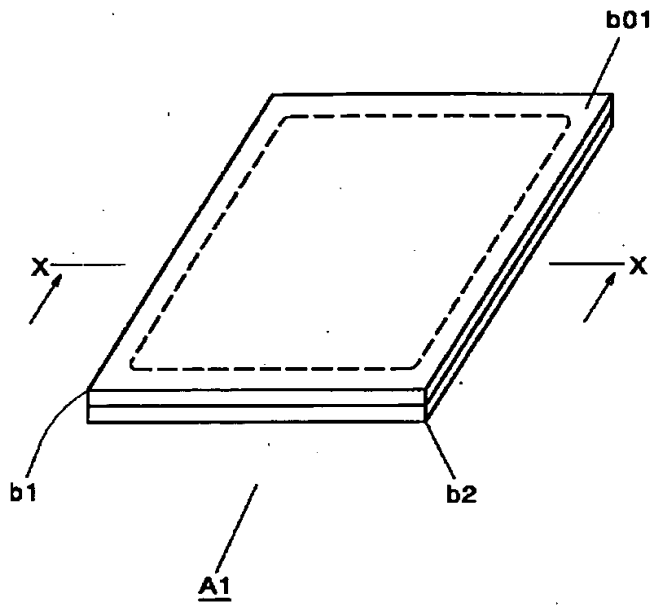

[PROBLEM]

5 To provide an ointment plaster which enables not only to simply strap the ointment on a diseased part but also to observe the state of the applied ointment.

[MEANS FOR SOLVING PROBLEM]

10 The ointment plaster comprises an ointment layer (a1) extended in a flat plate-like shape and cover films (b1),(b2) adhered to both the front and back sides of said ointment layer (a1), respectively. Therein, the outside of each of the cover films (b1),(b2) has a gas-impermeable property, and the inside has improved peelability from said ointment layer (a1), for example, by using a material similar to a nonwoven fabric. The outer peripheral portions (b01), (b02) of the cover films (b1), (b2) are projected
15 from the above-described ointment layer (a1) and peelably adhered to each other.
